

# SQL et connexion distante

Lorsque une infrastructure sépare le serveur SQL du serveur web, il faut changer la bin-address de mariaDB server.

*Exemple :*

En changeant cela il sera possible de requêter d'un autre client sur le serveur SQL.

- Modifier dans /etc/mysql/mariadb.conf.d/50-server.cnf

root@node02:/etc/mysql/mariadb.conf.d# ls  
50-client.cnf 50-mysql-client.cnf 50-mysqld\_safe.cnf 50-server.cnf 60-galera.cnf  
root@node02:/etc/mysql/mariadb.conf.d#

- Changer le bind-address en **0.0.0.0** :

```
GNU nano 5.4                               50-server.cnf

user                      = mysql
pid-file                 = /run/mysqld/mysqld.pid
basedir                  = /usr
datadir                  = /var/lib/mysql
tmpdir                   = /tmp
lc-messages-dir          = /usr/share/mysql
lc-messages              = en_US
skip-external-locking

# Broken reverse DNS slows down connections considerably and name resolve is
# safe to skip if there are no "host by domain name" access grants
#skip-name-resolve

# Instead of skip-networking the default is now to listen only on
# localhost which is more compatible and is not less secure.
bind-address            = 0.0.0.0

#
# * Fine Tuning
#
```
